<b>Lab Number:</b>	<b>5</b>
<b>Student Name:</b>	<b>Anushk Sawant</b>
<b>Roll No :</b>	<b>06</b>

**Title:**

To perform Operator Overloading using C++ for

- Multiplying 2 complex numbers
- adding matrices

**Learning Objective:**

- Students will be able to perform user-defined overloading of built-in operators.

**Learning Outcome:**

- Understanding the overloading concept on built-in operators.

**Course Outcome:**

<b>ECL304.2</b>	Comprehend building blocks of OOPs language, inheritance, package and interfaces
-----------------	--

**Theory:**

Explain about operator overloading with respect to:

- **Constructor :** Constructor overloading is a concept in which one class can have multiple constructors with different parameters. The main thing to note here is that the constructors will run according to the arguments for example if a program consists of 3 constructors with 0, 1, and 2 arguments, so if we pass 1 argument to the constructor the compiler will automatically run the constructor which is taking 1 argument.
- **methods :** Method overloading is the process of overloading the method that has the same name but different parameters. C++ provides this method of overloading features. Method overloading allows users to use the same name to another method, but the parameters passed to the methods should be different. The return type of methods can be the same or different.
- **Operators :** In C++, it can add special features to the functionality and behaviour of already existing operators like arithmetic and other operations. The mechanism of giving special meaning to an operator is known as operator overloading. For example, we can overload an operator '+' in a class like string to concatenate two strings by just using +.

**2021-22**

```
cin>>real;

cout<<"Img :";

cin>>img;
}

void complex::display()
{
cout<<"("<<real<<")"<<"+"<<"("<<img<<")"<<"i";
}

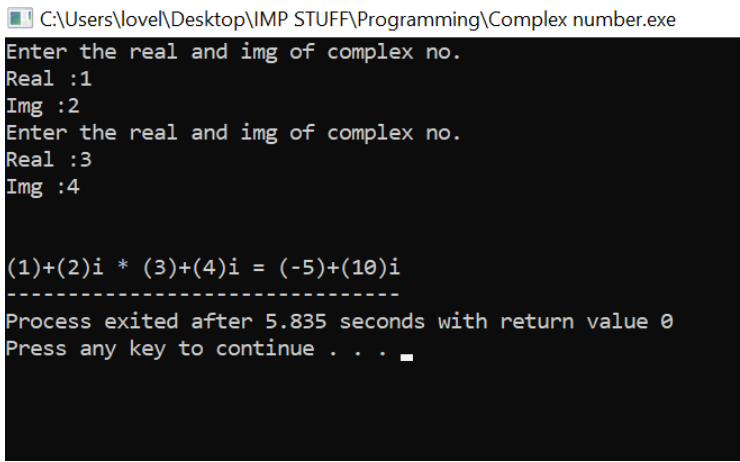

complex complex::operator*(complex c1)
{
    complex mul;
    mul.real = ((real*c1.real)-(img*c1.img));
    mul.img = ((real*c1.img)+(c1.real*img));
    return(mul);
}

int main()
{
    complex obj1,obj2,obj3;

    obj1.get_elements();
    obj2.get_elements();
    obj3= obj1*obj2;

    cout<<"\n\n";
    obj1.display();
```
